

Abstract

This work deals with systematics of eocrinoid echinoderms but also with their morphology and classification within the echinoderms. Two theories concerning systematic of eocrinoid echinoderms are compiled in this work. UBAGHS (1967) suggested the first version of systematics. SPRINKLE (1973) suggested the second one, still used version of systematics. Work is also focused on the occurrence of eocrinoid echinoderms in Cambrian and Ordovician rocks of the Barrandien area.
